

Cyborg Mommy

(Everything I Know About Computers
I Learned From Mother)

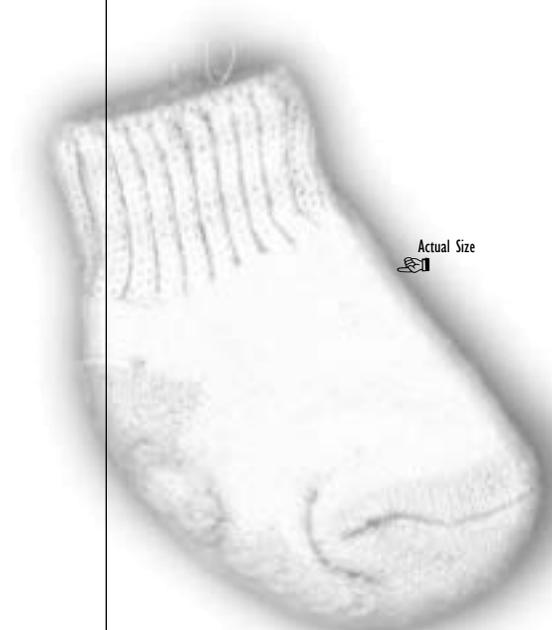

Cyb(ernetic) Org(anism)
MFAY2K

As machines and bodies increasingly become fused, Cyborg Theory celebrates, criticizes, and condemns the process. The machine/body relationship is at once liberating and oppressing. While movies and fiction depict the Cyborg as a futuristic superhuman or technological monster, my new body of work proposes that it is actually your average Mother and Housewife that are among the first so-called Cyborgs.

The machine has extended the body of the mother for centuries as she tended the stove, cranked the washer, peddled the sewing machine, and vacuumed the house, but she hardly exists in discussions of technological culture, except as a consuming unit for manufacturing and advertising or in the case of reproductive technologies – the body that carries the baby. There has been little or no discussion about the postpartum technologizing of the mother and child. With microchips embedded in everything from toys and greeting cards to thermometers and baby monitors, increasingly, the mother/child relationship is mediated, complicated and enhanced by machines. We are encouraged to feed our infants information as if we were storing data on a hard drive with a push to begin “programming” their brains in utero.

What is a cyborg mother to do? Here’s to the recognition of the Cyborg Mommy – the Cyborg as oppressed and the Cyborg as liberated. These works attempt to initiate a dialog that includes the invisible women without whom there would be no technological world. Cyborg Mommy is an ongoing body of work that includes video, multimedia CD ROM, performance, costume, books, digital ephemera and printed matter.

Mother taught me everything I know.
